

TenderPilot

"AI copilot that turns any public tender document into a winning bid in minutes"

Problem: Kosovo and the Balkans receive billions in EU IPA funds and national budget procurement every year. Public tenders are legally mandated and publicly posted — but the documents are 80–200 pages of dense legal/technical requirements. SMEs consistently lose bids not because they lack capability, but because they can't decode the requirements, miss eligibility criteria, or write non-compliant responses. This is a €2B+ annual opportunity that small businesses are locked out of.

Target Users: SMEs, NGOs, construction firms, IT companies, consultancies bidding on public contracts

Why Now: EU integration pressure is forcing Kosovo/Balkans to publish more tenders digitally. Document AI (Claude, GPT-4o with vision) can now read and reason over 100-page PDFs reliably. Structured output makes extraction deterministic.

AI Features:

- PDF ingestion + multimodal analysis of tender documents
- Automatic extraction: eligibility criteria, deadlines, required documents, scoring weights
- Gap analysis: "You are missing these 4 documents to qualify"
- AI-drafted bid sections (executive summary, technical approach, team qualifications)
- RAG over company profile to personalize bids
- Scoring simulation: "Based on the criteria, your bid scores ~73/100"

Technical Complexity: 6/10 **Demo Wow Factor:** 9/10 **Chance of Winning:** 8.5/10

Monetization: SaaS subscription €99–499/month per company. €5K+ per successful large bid (outcome-based). Kosovo + regional expansion = large TAM. **Scalability:** Every country has public procurement. EU alone = €2 trillion annually.

What Makes It Different: No existing tool focuses on Balkan/Kosovo tenders in Albanian. Global competitors (Periscope, Bonfire) are enterprise-only and English-only.

2-Day MVP: Upload tender PDF → AI extracts requirements → checklist view → AI drafts 3 sections → export to Word/PDF
